Revision History

Revision	Description	Date	
v01	Initial release	2025/01/10	
v02	1. Fixed the DCDC power enable control problem and reversed the enable logic 2. Replaced the charging management chip with TI BQ25101 and added the battery charging temperature detection function 3. Modified the battery installation method and improved the assembly process 4. Added another microphone and modified the microphone installation method for easy assembly 5. Added a rectifier bridge at the charging input to avoid reverse power connection during magnetic charging 6. Added another LED to improve the light transmission effect	2025/04/01	
v03	1. Add a manual reset function. Press and hold the button and place the device on the charger to reset the MCU. 2. Change the power input rectifier bridge circuit to an anti-reverse connection circuit to reduce the voltage drop caused by the input diode and avoid affecting the charging current. 3. Add power control of the RF analog switch to save power consumption.	2025/04/15	
v04	1. Updated the layout to solve the problem of poor WiFi 2.4G signal 2. Changed the vibration motor to LDO power supply to improve vibration reliability 3. Changed the positioning pin of J1 to NC, which is short-circuited with the signal pin on the connector	2025/05/12
